

# Microbit handle control

---

## Microbit handle control

1. Learning objectives
2. Building blocks
3. Motor wiring
4. Programming
  - 4.1 Add expansion package
  - 4.2 Building blocks used
  - 4.3 Add variables
  - 4.4 Assemble building blocks
5. Experimental phenomenon

## 1. Learning objectives

---

In this course, we mainly learn how to use MakeCode graphical programming to realize the control of Skip car by microbit handle.

## 2. Building blocks

---

For the building blocks steps, please refer to the installation drawings of **[Assembly Course]-- [Skip car]** in the materials or the building blocks installation book.

## 3. Motor wiring

---

Insert the motor wiring on the left side of the car into the M1 interface of the Super:bit expansion board, and the black wire is close to the battery side;

Insert the motor wiring on the right side of the car into the M3 interface of the Super:bit expansion board, and the black wire is close to the battery side;

Insert the building blocks servo wiring into the S1 interface of the Super:bit expansion board, and the orange servo wiring is inserted into the yellow pin of S1.

As shown in the figure below:

#### **! Notes:**

When taking the course related to the building block servo for the first time, we need to remove the gear on the servo and upload the program of this course to the micro:bit; then turn on the power switch of the Super:bit expansion board and wait for the building block servo to turn to the initial position; then, we can turn off the power, adjust the angle of the car loading platform to be parallel to the ground, and then install the servo gear. (If you have used Skip car and servo-related programs before, you can skip this step)

## **4. Programming**

### **Method 1 Online Programming:**

First, connect the micro:bit to the computer via a USB data cable, and a U disk will pop up on the computer. Click the URL in the U disk: <https://makecode.microbit.org/> to enter the programming interface. Then, add the Yahboom software package to program.

## Method 2 Offline Programming:

Open the offline programming software MakeCode and enter the programming interface. Click [New] and add the Yahboom software package to start programming.

**superbit kit expansion package:** <https://github.com/YahboomTechnology/SuperBitLibV2>

**Handle expansion package:** <https://github.com/YahboomTechnology/GHBitLib>

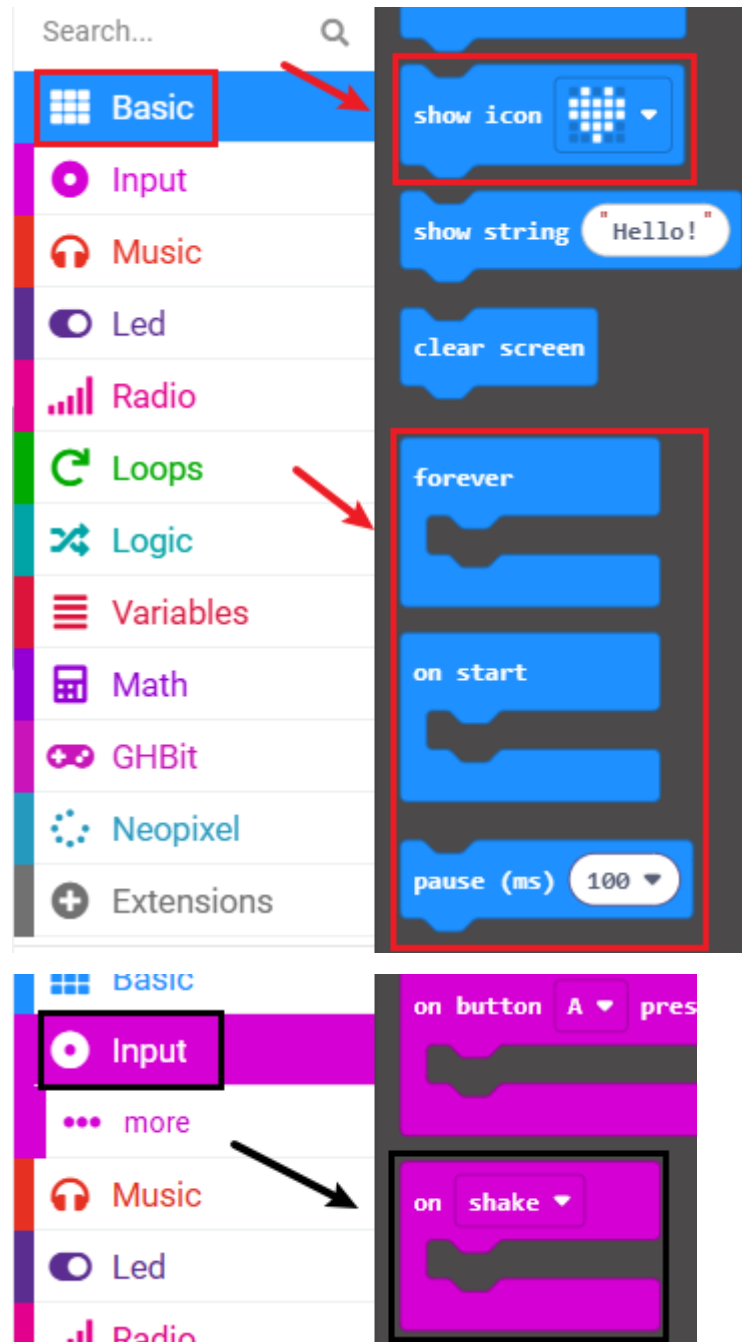

## 4.1 Add expansion package

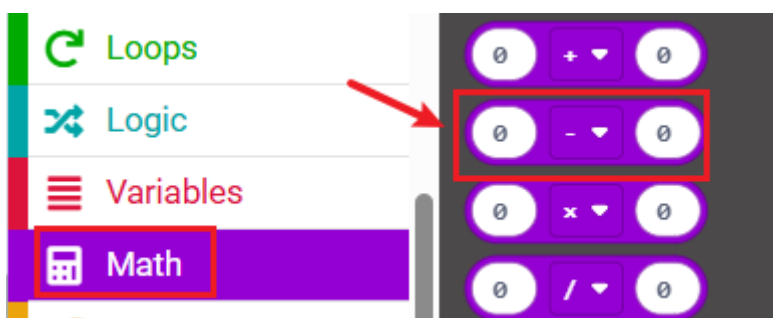

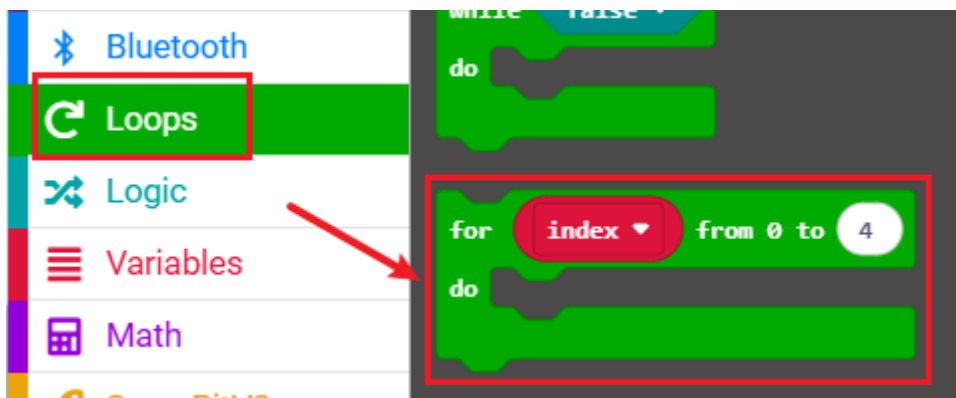

The image shows the MakeCode IDE interface. The top part displays a virtual breadboard with components like a sensor (A), a motor (B), and a display. The right sidebar contains a menu of categories: Basic, Input, Music, Led, Radio, Loops, Logic, Variables, Math, Extensions, and Advanced. The 'Extensions' category is highlighted with a red box.

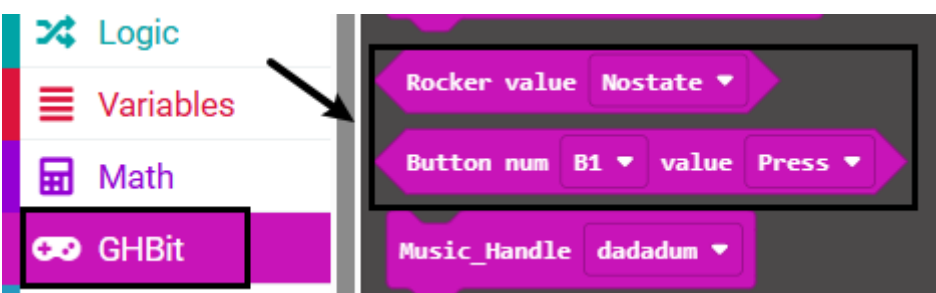

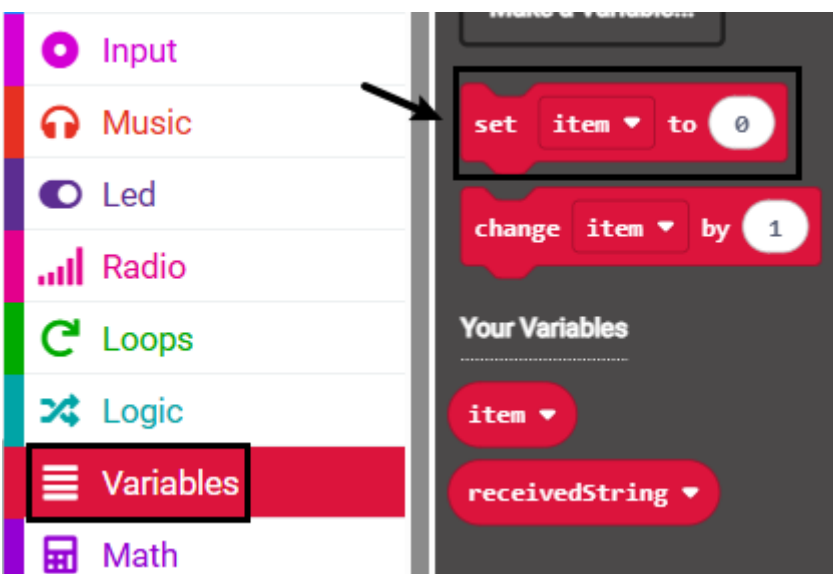

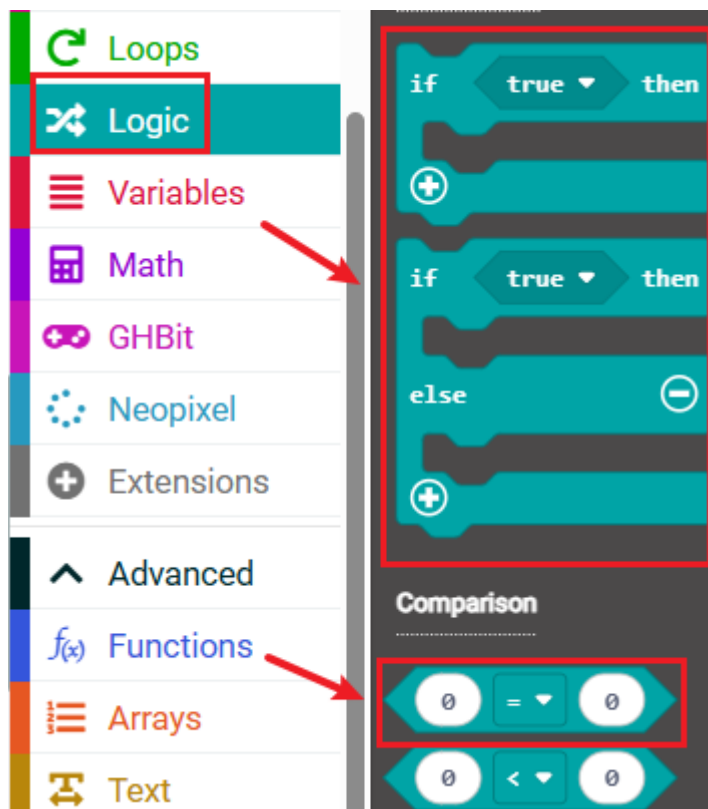

The bottom part of the image shows the 'Extensions' panel. At the top, there is a search bar (labeled 2) and a list of categories: Lights and Display, Software, Science, Robotics, Gaming, and Networking. The 'Software' category is selected. Below the categories, the 'SuperBitV2' extension is listed (labeled 3). The extension is described as 'Extension for YahBoom SuperBitV2'. At the bottom of the extension card, it says 'User-provided extension, not endorsed by Microsoft. Learn More'.

## 4.2 Building blocks used

The location of the building blocks required for this programming is shown in the figure below.

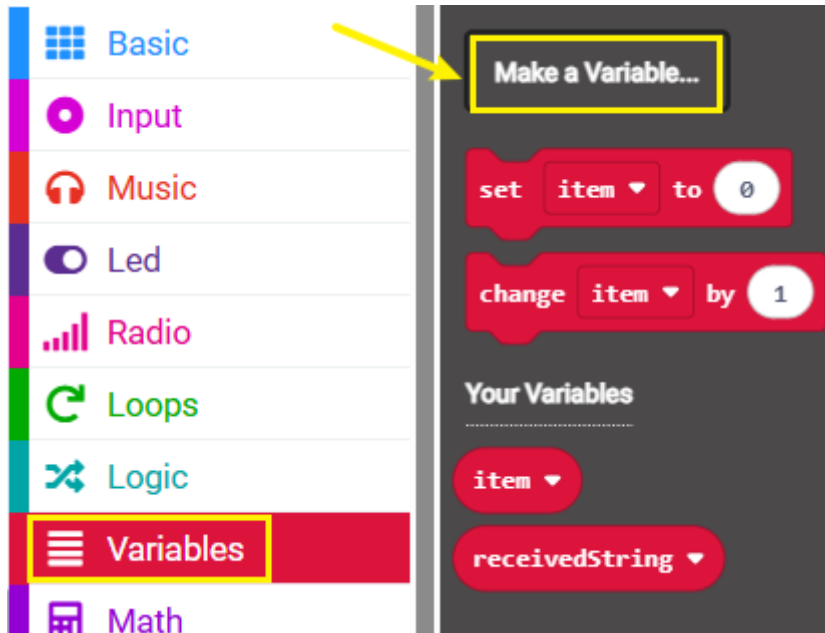

## 4.3 Add variables

① Find the [Variable] option in the block bar----[Set variables]

② Enter the variable name to complete the new variable.

A screenshot of a dialog box titled 'New variable name:'. It has a close button (X) in the top right corner. Below the title is a text input field containing the word 'value'. At the bottom right of the dialog is a green button with the text 'Ok' and a checkmark icon, which is highlighted with a red box.

## 4.4 Assemble building blocks

The summary program of microbit on **Skip car** is shown in the figure below

```

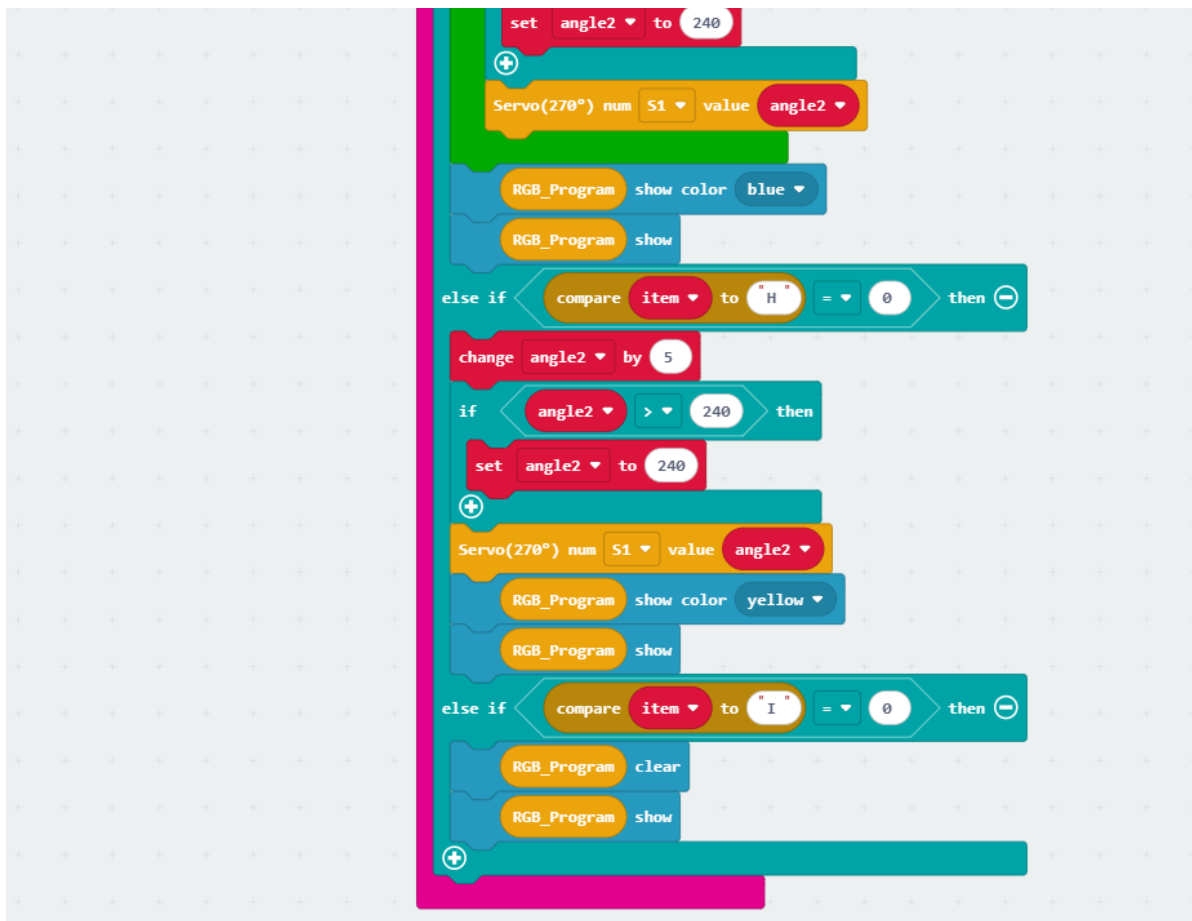

on start
  set angle13 to 0
  radio set group 1
  radio set transmit power 7
  show icon [icon]
  set angle2 to 240
  Servo(270°) num S1 value 240

```

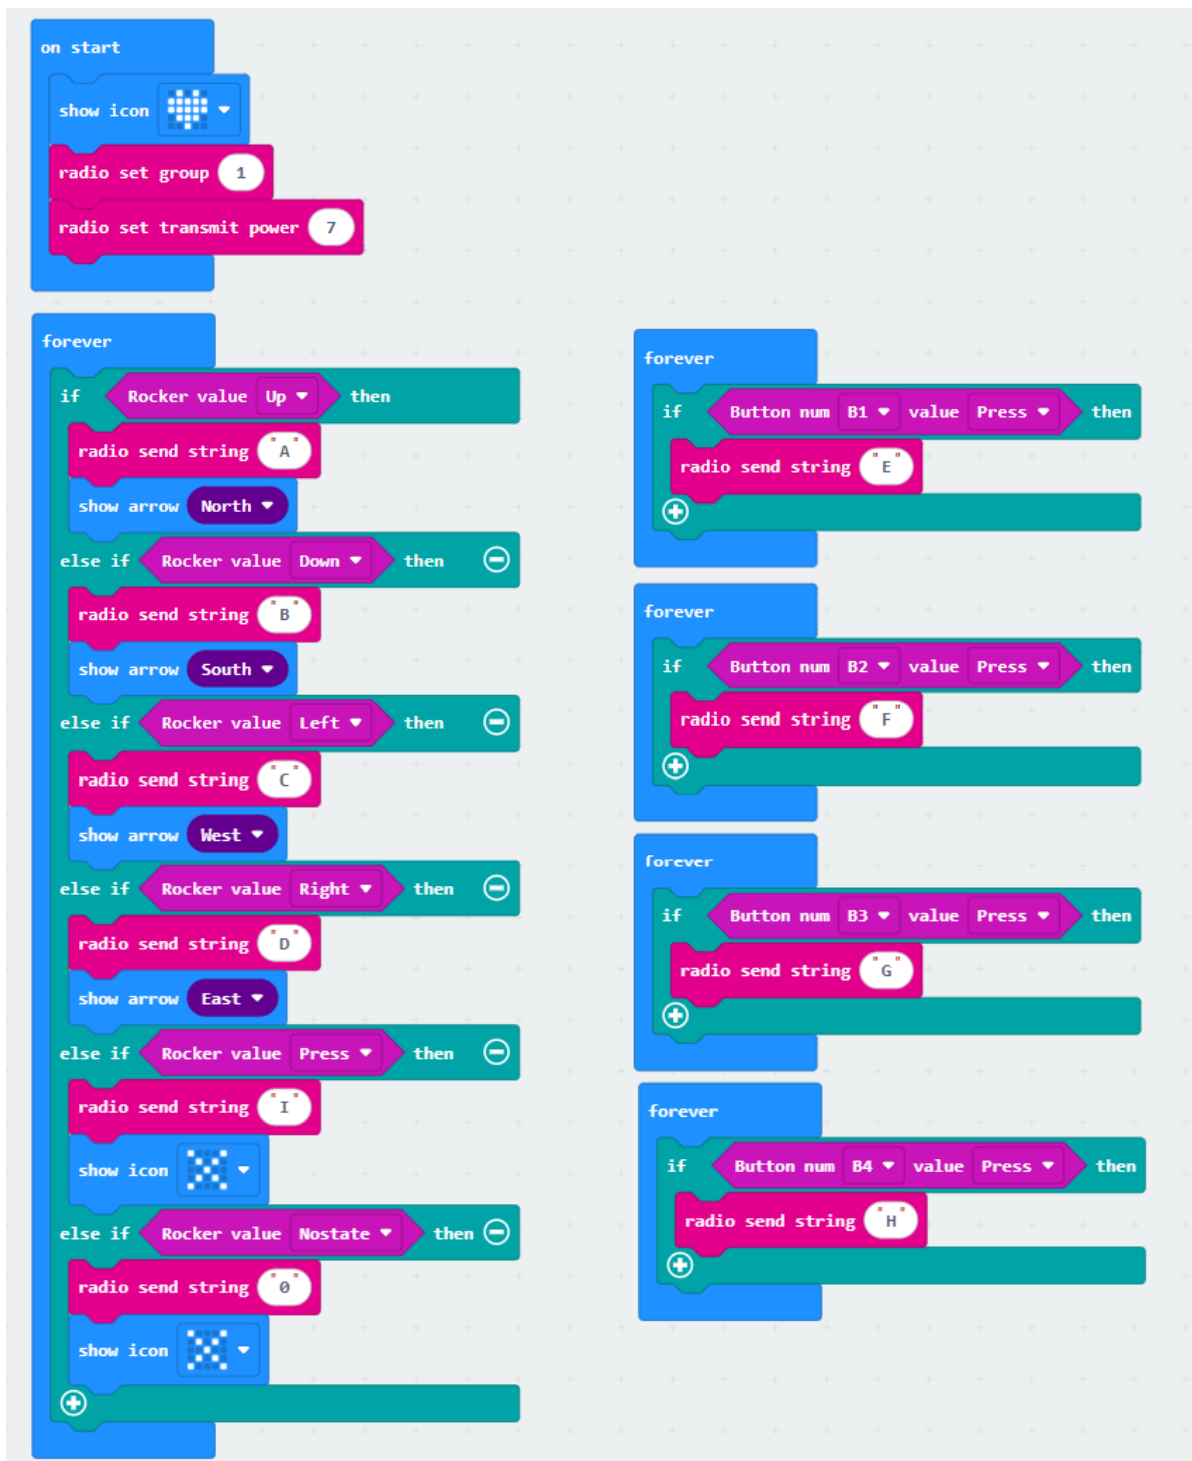

```

on radio received receivedString
  set item to receivedString
  if <compare item to "A" = 0> then
    Motor M1 speed(-255~255) 255
    Motor M3 speed(-255~255) 255
  else if <compare item to "B" = 0> then
    Motor M1 speed(-255~255) -255
    Motor M3 speed(-255~255) -255
  else if <compare item to "C" = 0> then
    Motor M1 speed(-255~255) -255
    Motor M3 speed(-255~255) 255
  else if <compare item to "D" = 0> then
    Motor M1 speed(-255~255) 255
    Motor M3 speed(-255~255) -255
  else if <compare item to "0" = 0> then
    Motor M1 speed(-255~255) 0
    Motor M3 speed(-255~255) 0
  else if <compare item to "E" = 0> then
    change angle2 by -5
    if <angle2 < 60> then
      set angle2 to 60
    +
    Servo(270°) num S1 value angle2
    RGB_Program show color red
    RGB_Program show
  else if <compare item to "F" = 0> then
    for angle1 from 0 to 180
    do
      set angle2 to angle2 - angle1
      if <angle2 < 60> then
        set angle2 to 60
      +
      Servo(270°) num S1 value angle2
    RGB_Program show color green
    RGB_Program show
  else if <compare item to "G" = 0> then
    for angle12 from 0 to 180
    do
      set angle2 to angle2 + angle12
      if <angle2 > 240> then

```

**Handle rocker control** program is as follows

Handle gravity control program is as follows

You can also directly open the **microbit-handle remote control-Skip car.hex**, **microbit-handle joystick control.hex**, **microbit-handle gravity control.hex** files provided in this experiment and drag them into the browser that opens the URL, and the program diagram of this project source code will be automatically opened

## 5. Experimental phenomenon

We need to download the Skip car program to the micro:bit motherboard of Skip car, open Skip car's power switch, we can see a smiley face pattern on the micro:bit dot matrix;

Download the controller remote control program to the micro:bit mainboard of the controller, turn on the power switch of the controller, we can see that the micro:bit dot matrix will initialize to display a heart pattern, and then an "X" pattern will be displayed, indicating that the controller is in the default state and no data is sent.

The two will automatically complete the pairing, and then we can start to remotely control Skip car.

The controller functions are as follows.

**!Note:** In the case of controller joystick control, press the joystick to control the RGB light to go out, and this function does not exist in the case of gravity control of the controller.
